

311 Complaint: Street Condition

&

Motor Vehicle Collisions Crashes

Narrative Description:

The first dataset that was selected contains 311 service requests from 2010 to present in New York City. According to the 311 Service Requests data, in 2017, street condition was the 5th most common complaint issue with a total of 93,270 complaints for the year alone. Therefore, this specific complaint type was chosen to explore whether vehicle accidents are more likely to occur depending on road conditions.

Street condition complaints could be key indicators in predicting the likelihood of collisions and essential in preventing future crashes. As a result, a second dataset has been selected that contains the details on motor vehicle collision events in New York City. By merging these two datasets, we hope to find correlations between complaints of road conditions, which included potholes, failed street repairs, and more, and vehicle collisions.

For instance, with the information that we have, we hope to easily identify which locations should often receive inspections to assess the road conditions due to the higher volume of complaints. As well as what time of the year would streets have hazardous road conditions? For instance, during the fourth quarter of the year where there are more snow storms, streets would be more damaged than the rest of the year. By having access to this information, it would be easier for us to prepare and improve the road conditions and thus, reduce vehicle accidents drastically.

Data Sources

1. [311 Service Requests](#)
2. [Motor Vehicle Collisions Crashes](#)

Extracted Sample Data:

1. [311 Service Requests](#)
2. [Motor Vehicle Collisions](#)

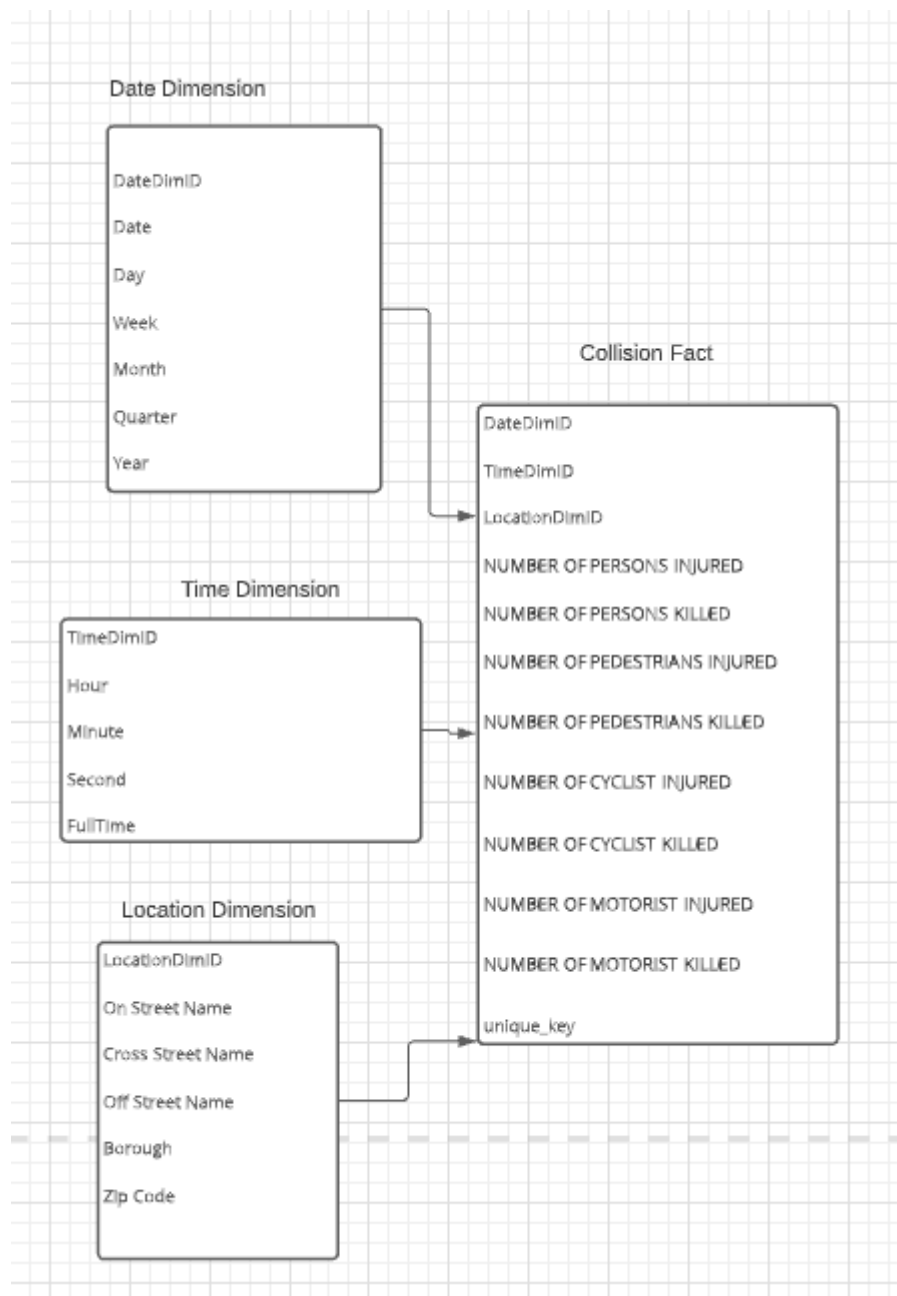

KPIs

1. Street Condition Complaints and Collisions Count by Zip Code
2. Number of Persons Killed By Borough
3. Number of Persons Injured by Borough
4. Number of Deaths by Road Condition Description
5. Occurrences of Road Condition Complaints Based on Collisions

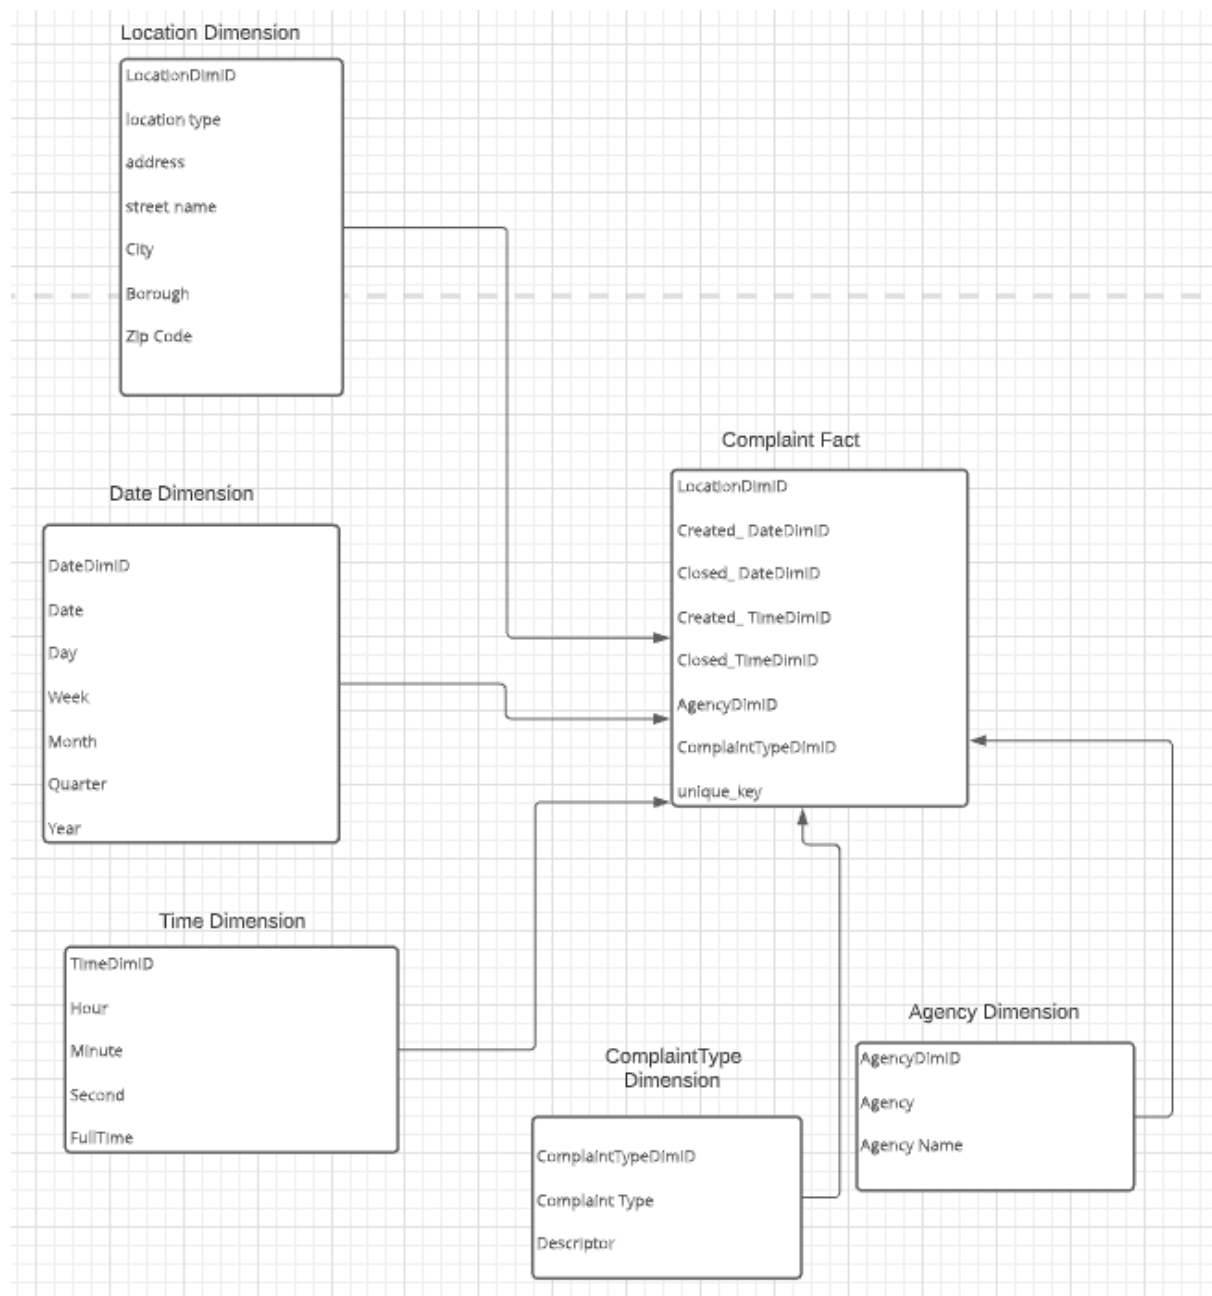

Dimensional Model: [Link to LucidChart Dimensional Model](#)

Some KPIs involve frequency monitoring based on time. Therefore, transaction grain has been selected for every record in the fact table for each of the transactions. The only attribute that would most likely change is location; however, infrequently. Thus, type 3 slowly changing dimensions has been selected.

Collision Fact

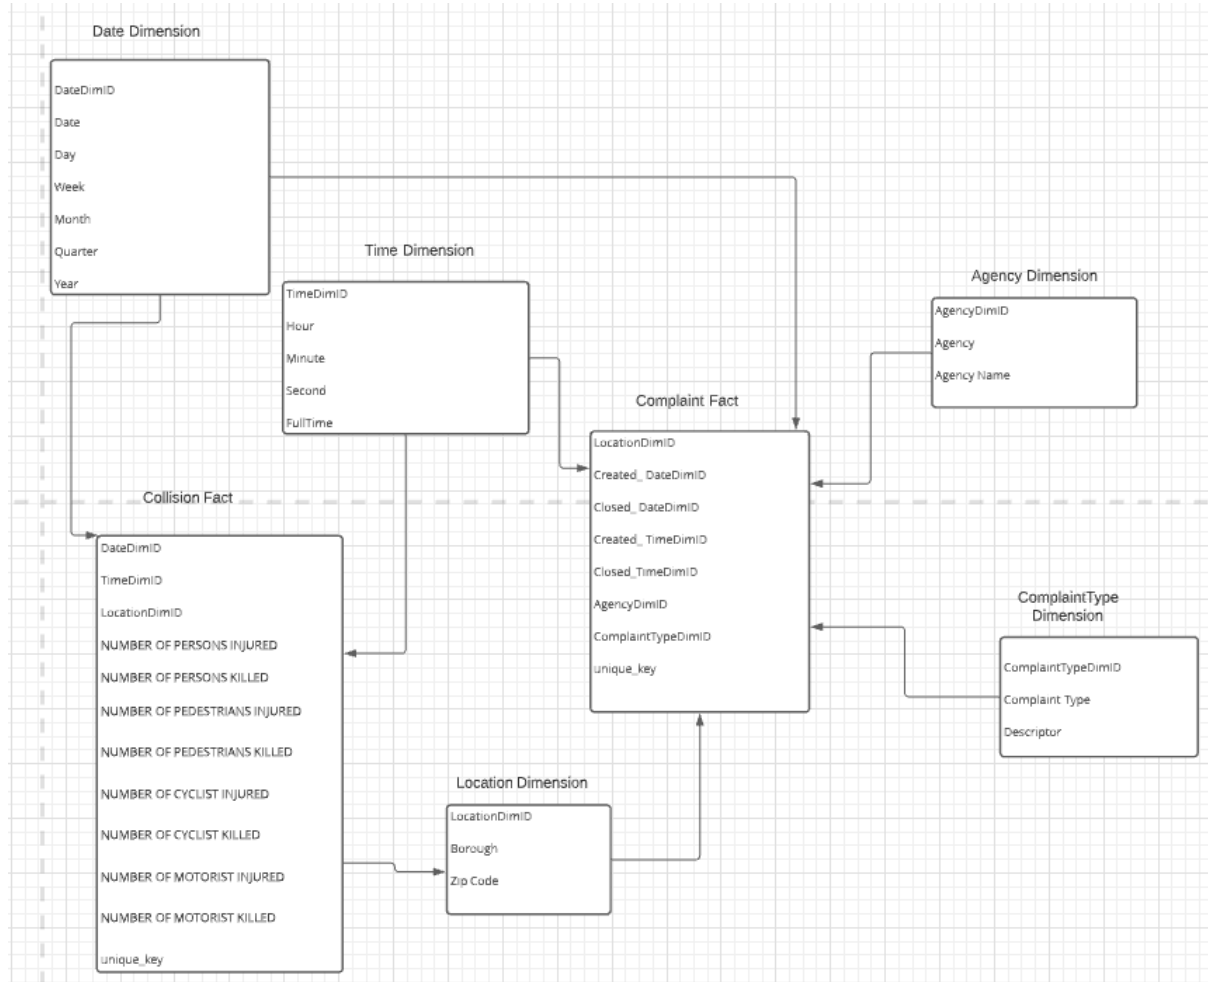

Complaint Fact

Final Dimensional Schema (Integrated Model)

The Collision and Complaint fact tables share Date, Time and Location dimensions.

The Complaint fact table also contains Agency and ComplaintType dimensions.

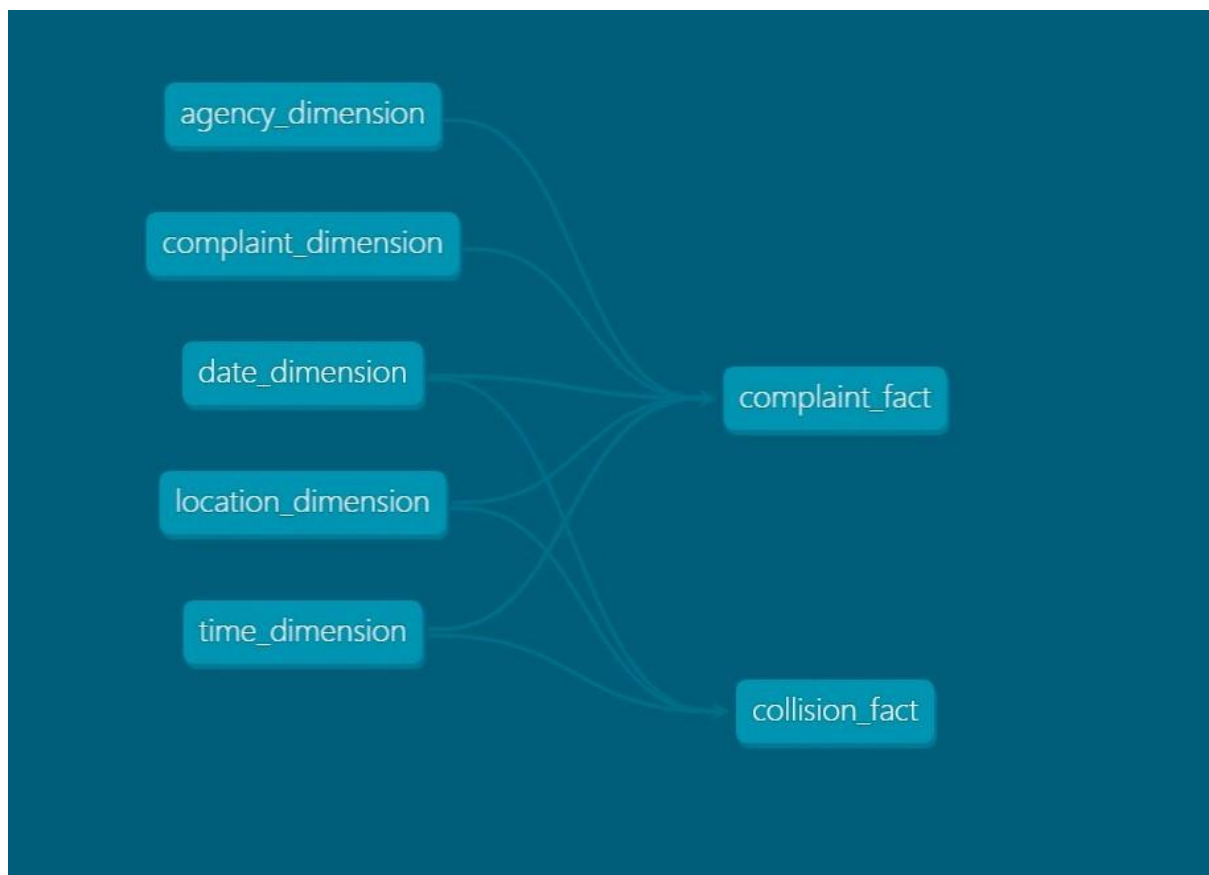

Data Profiling: [Data Profiling](#)

A Pandas module was used for profiling. This was a quick exploratory analysis step we took before proceeding. These multiple visualisations saved a lot of time and gave us an understanding of the distribution of each variable.

ETL Programming For Dimensions and Fact Tables:

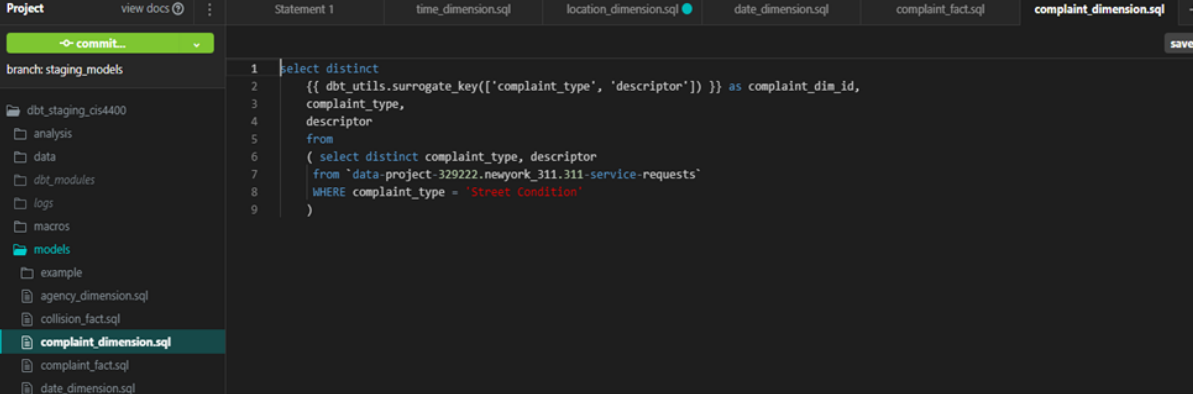

Lineage Graph

With the ETL tool DBT, we created our dimension models and fact tables. The diagram shows the relationship between each dimension to the fact tables.

Complaint Type Dimension

A surrogate key is created and the complaint type and descriptor columns are created. It will also display these columns in the dimension. Our “where” clause only takes records for the specific complaint type, “Street Condition”.

```
1 select distinct
2   {{ dbt_utils.surrogate_key(['complaint_type', 'descriptor']) }} as complaint_dim_id,
3   complaint_type,
4   descriptor
5 from
6   ( select distinct complaint_type, descriptor
7     from `data-project-329222.newyork_311.311-service-requests`
8     where complaint_type = 'Street Condition'
9   )
```

5.4 sec —Returned 29 rows. [Download CSV](#)

complaint_dim_id	complaint_type	descriptor
cc4adc1e3005400adb9e53616c5d0f	Street Condition	Wear & Tear
e523ff5dc47f230b99120449ebd44af4	Street Condition	Plate Condition - Noisy

Runs Start typing to enter a dbt command Enter ready

Location Dimension

The datasets are integrated by zip code and borough. After unioning the separate location tables for the datasets, the location dimension was created with a surrogate key.

The screenshot displays a data engineering tool interface with a dark theme. On the left, a project tree shows a folder named 'models' containing several SQL files, with 'location_dimension.sql' selected. The main editor shows a SQL query for creating a table named 'location_dim'. The query uses CTEs to extract distinct zip codes from 'service-requests' and 'collisions' tables, then joins them with a 'Boroughs' table to create a surrogate key for each combination of borough and zip code.

```
1 WITH table1 AS (select distinct CAST(incident_zip AS STRING) as zipcode
2   from `data-project-329222.newyork_311.service-requests`),
3
4 table2 AS (select distinct CAST(zip_code AS STRING) as zipcode
5   from `data-project-329222.newyork_311.collisions`),
6
7 final as ( SELECT * from table1
8   UNION ALL
9   SELECT * from table2),
10
11 boroughs as (SELECT CAST(Zip AS STRING) AS Zip, Borough FROM `data-project-329222.newyork_311.Boroughs`),
12
13 finalborough as (SELECT Borough,zipcode FROM final INNER JOIN boroughs ON Zip = zipcode)
14
15 SELECT distinct {{ dbt_utils.surrogate_key(['Borough', 'zipcode']) }} as location_dim_id,Borough,zipcode
16 FROM finalborough
17
```

Below the query editor, the 'Query Results' tab is active, showing the execution time of 7.1 seconds and 229 rows returned. A table of results is displayed with columns 'location_dim_id', 'Borough', and 'zipcode'. All rows in the visible sample have the borough of 'MANHATTAN'.

location_dim_id	Borough	zipcode
9ccccfcd14ddb74f651bce1a5bf92c	MANHATTAN	10001
eb635750e5617fa0206209723bdc5b85	MANHATTAN	10002
59a43c1116fe65925a0364852e756383	MANHATTAN	10003
b63b408b9365f1417ee1fec8ab7505b5	MANHATTAN	10004
2f80f60d6c715d3b52106d77d5fd7b80	MANHATTAN	10005
1e2819f638e1c568a12f497e39967563	MANHATTAN	10006
6c8361db585f86bf4a336fb292b27571	MANHATTAN	10007
feca646746683d2b17ae9e879f97b9b1	MANHATTAN	10009
4821fc0bca481e06d4828370d57c8fa	MANHATTAN	10010

At the bottom of the interface, there is a 'Runs' section with a text input field for entering a dbt command and a 'ready' status indicator.

Time Dimension

A CSV file was integrated that contains time_dim_id, fulltime, hours, minutes, and seconds. It was uploaded to BigQuery and selected all records from this dataset to create the time dimension.

The screenshot shows the dbt CLI interface with the following components:

- Project:** dbt_staging_cis4400
- branch:** staging_models
- Models:** dbt_staging_cis4400, analysis, data, dbt_modules, logs, macros, models, example, agency_dimension.sql, collision_fact.sql, complaint_dimension.sql, complaint_fact.sql, date_dimension.sql, location_dimension.sql, time_dimension.sql (selected), packages, snapshots, tables, target, tests, .gitignore, dbt_project.yml, packages.yml, profile.yml, README.md
- Query:** 1 select * from `data-project-329222.newyork_311.time`
- Query Results:** 5.5 sec —Results limited to 500 rows. [Download CSV](#)
- Table:**

time_dim_id	fulltime	hours	minutes	seconds
1	00:00:00	0	0	0
2	00:00:01	0	0	1
3	00:00:02	0	0	2
4	00:00:03	0	0	3
5	00:00:04	0	0	4
6	00:00:05	0	0	5
7	00:00:06	0	0	6

Runs: dbt run --full-refresh Enter ready

Date Dimension

The dbt utils package was installed to construct a date dimension with the dimension ID, full date, the number sequence of day (out of 365 days) in the year, the day of the week, the number sequence of week (out of 52 weeks) the day falls in in the year, the month of the year, the quarter in the year, and the year.

Code Source: gitlab-data/analytics/date

The screenshot displays the dbt CLI interface. On the left, the project structure is visible, with the `models` directory expanded and `date_dimension.sql` selected. The main panel shows the SQL code for the `date_dimension` model, which uses the `dbt_utils.date_spine` macro to generate a date dimension table. The code includes a `WITH` clause for `DATE_SPINE` and a `SELECT` statement that extracts various date components into columns.

```
1 WITH DATE_SPINE AS (  
2   {{ dbt_utils.date_spine(  
3     datepart="day",  
4     start_date="cast('2015-01-01' as date)",  
5     end_date="cast('2022-01-01' as date)"  
6   })  
7 })  
8 )  
9 )  
10 SELECT  
11   ROW_NUMBER() OVER() as DATE_DIM_ID,  
12   CAST(DATE(DATE_DAY) AS DATE) AS DATE_DAY,  
13   EXTRACT(DAY FROM DATE_DAY) AS YEAR_DAY,  
14   FORMAT_DATE('%a', DATE_DAY) as Day_Name,  
15   EXTRACT(WEEK FROM DATE_DAY) AS YEAR_WEEK,  
16   EXTRACT(MONTH FROM DATE_DAY) AS YEAR_MONTH,  
17   EXTRACT(QUARTER FROM DATE_DAY) AS YEAR_QUARTER,  
18   EXTRACT(YEAR FROM DATE_DAY) AS YEAR  
19
```

Below the code, the `Query Results` tab is active, showing the output of the query. The results are limited to 500 rows and took 8.4 seconds to execute. The table has 8 columns: `DATE_DIM_ID`, `DATE_DAY`, `YEAR_DAY`, `Day_Name`, `YEAR_WEEK`, `YEAR_MONTH`, `YEAR_QUARTER`, and `YEAR`. The first 9 rows are displayed, showing dates from 2015-01-01 to 2015-01-09.

DATE_DIM_ID	DATE_DAY	YEAR_DAY	Day_Name	YEAR_WEEK	YEAR_MONTH	YEAR_QUARTER	YEAR
1	2015-01-01	1	Thursday	0	1	1	2015
2	2015-01-02	2	Friday	0	1	1	2015
3	2015-01-03	3	Saturday	0	1	1	2015
4	2015-01-04	4	Sunday	1	1	1	2015
5	2015-01-05	5	Monday	1	1	1	2015
6	2015-01-06	6	Tuesday	1	1	1	2015
7	2015-01-07	7	Wednesday	1	1	1	2015
8	2015-01-08	8	Thursday	1	1	1	2015
9	2015-01-09	9	Friday	1	1	1	2015

Agency Dimension

Agency name and agency as the surrogate key from the 311 Service Requests dataset.

It will also display these columns with the original values in the dimension.

The screenshot displays a data engineering tool interface with a sidebar on the left showing a project structure. The main area is divided into a code editor and a results panel. The code editor shows a SQL query for creating a dimension table. The results panel shows the query execution results, including a table with columns for surrogate keys, agency names, and agency identifiers.

SQL Query:

```
1 select distinct
2   {{ dbt_utils.surrogate_key(['agency_name', 'agency']) }} as agency_dim_id,
3   agency_name,
4   agency
5 from
6   ( select distinct agency_name, agency
7     from `data-project-329222.newyork_311.311-service-requests`
8   )
9
```

Query Results:

agency_dim_id	agency_name	agency
c21f27c5e4a8b6c1af6381def5234f62	Department of Sanitation	DSNY
f92c612cbb6cef8cc05a9eea4d21ed87	Department for the Aging	DFTA

Collision Fact

We have selected the dimensions ID, the degenerated dimension, and the columns from the Collision dataset that will add valuable information to create the KPIs. The datasets are joined with the related dimensions (Date, Location, and Time) on the shared columns in order to display the table.

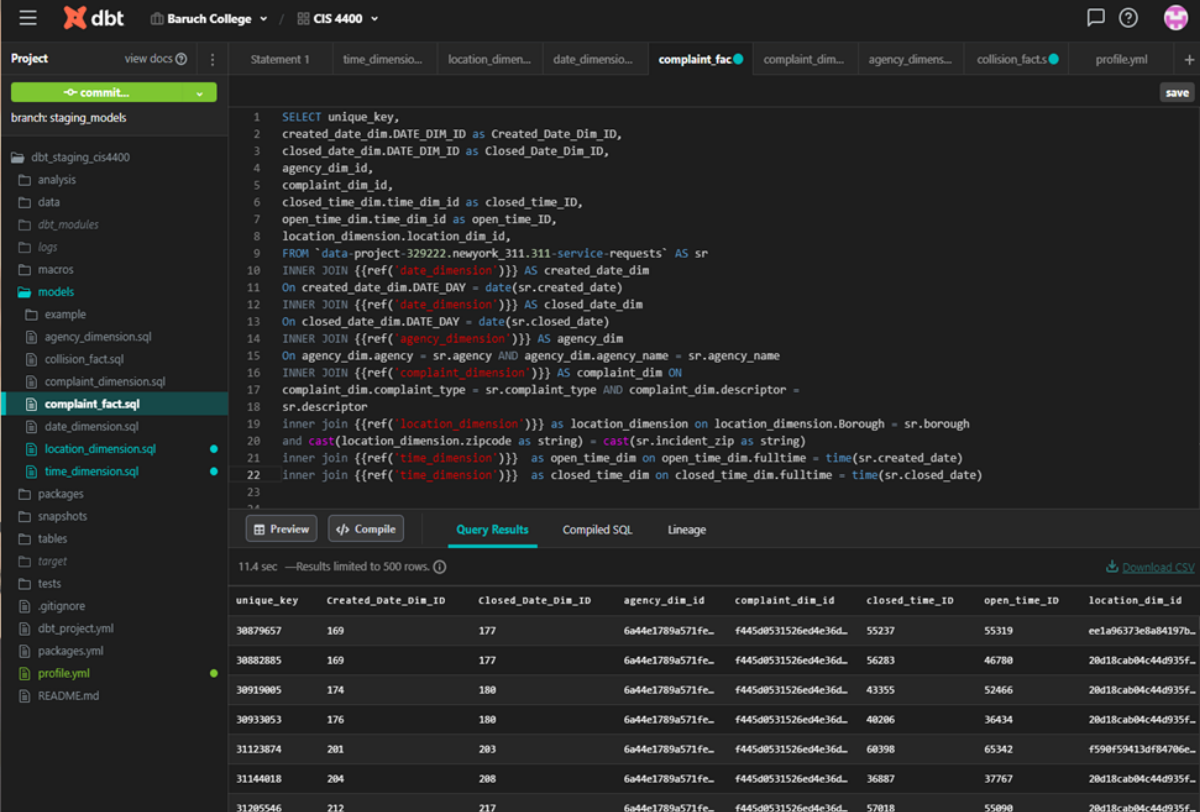

The screenshot displays the dbt CLI interface. On the left, the project file tree is visible, with 'collision_fact.sql' selected under the 'models' directory. The main panel shows the SQL code for the 'collision_fact' model, which joins the 'data-project-329222.newyork_311.collisions' fact table with 'date_dimension', 'location_dimension', and 'time_dimension' dimension tables. Below the code, the 'Query Results' tab is active, showing a table with 8 columns and 8 rows of data. The columns are: date_dim_id, time_dim_id, location_dim_id, unique_key, number_of_cyclist_injured, number_of_cyclist_killed, number_of_motorist_injured, and number_of_motorist_killed. The bottom of the interface shows the command 'dbt run --full-refresh' being executed, with a 'ready' status indicator.

```
1 select date_dim_id, time_dim_id, location_dim_id, unique_key, number_of_cyclist_injured,
2 number_of_cyclist_killed, number_of_motorist_injured, number_of_motorist_killed,
3 number_of_pedestrians_injured, number_of_pedestrians_killed, number_of_persons_injured, number_of_persons_killed
4 from `data-project-329222.newyork_311.collisions` as col
5 inner join {{ref('date_dimension')}} as date_dimension on date_dimension.DATE_DAY = date(col.timestamp)
6 inner join {{ref('location_dimension')}} as location_dimension on location_dimension.Borough = col.borough
7 and cast(location_dimension.zipcode as int) = col.zip_code
8 inner join {{ref('time_dimension')}} as time_dimension on time_dimension.fulltime = time(col.timestamp)
```

date_dim_id	time_dim_id	location_dim_id	unique_key	number_of_cyclist_injured	number_of_cyclist_killed	number_of_motorist_injured	number_of_motorist_killed

Complaint Fact

We have selected the dimension IDs and the degenerated dimension that are critical for this fact table. The dataset are joined with the related dimensions (Date, Location, Agency, Complaint_Type, and Time) on the shared columns in order to display the table.

The screenshot displays the dbt CLI interface for a project named 'Baruch College' under the 'CIS 4400' schema. The 'complaint_fact' model is selected, showing its SQL definition and the resulting query results.

SQL Definition:

```
1 SELECT unique_key,
2 created_date.dim.DATE_DIM_ID as Created_Date_Dim_ID,
3 closed_date.dim.DATE_DIM_ID as Closed_Date_Dim_ID,
4 agency_dim_id,
5 complaint_dim_id,
6 closed_time.dim.time_dim_id as closed_time_ID,
7 open_time.dim.time_dim_id as open_time_ID,
8 location_dimension.location_dim_id,
9 FROM `data-project-329222.newyork_311.311-service-requests` AS sr
10 INNER JOIN {{ref('date_dimension')}} AS created_date_dim
11 ON created_date_dim.DATE_DAY = date(sr.created_date)
12 INNER JOIN {{ref('date_dimension')}} AS closed_date_dim
13 ON closed_date_dim.DATE_DAY = date(sr.closed_date)
14 INNER JOIN {{ref('agency_dimension')}} AS agency_dim
15 ON agency_dim.agency = sr.agency AND agency_dim.agency_name = sr.agency_name
16 INNER JOIN {{ref('complaint_dimension')}} AS complaint_dim ON
17 complaint_dim.complaint_type = sr.complaint_type AND complaint_dim.descriptor =
18 sr.descriptor
19 inner join {{ref('location_dimension')}} as location_dimension on location_dimension.Borough = sr.borough
20 and cast(location_dimension.zipcode as string) = cast(sr.incident_zip as string)
21 inner join {{ref('time_dimension')}} as open_time_dim on open_time_dim.fulltime = time(sr.created_date)
22 inner join {{ref('time_dimension')}} as closed_time_dim on closed_time_dim.fulltime = time(sr.closed_date)
```
